

Gitlab SSH Access

To be able to clone projects from the Project Gitlab server you must:

- Install git tooling locally on your PC from <https://git-scm.com/>
Don't forget to install the normal, bare bone client before installing GUI clients, like e.g. <https://git-scm.com/download/win> .
- Make sure you have access / an account the Project GitLab server.
You'll get an account automatically after your first login at <https://projects.fhict.nl/>
Use the "Staff & Student Login" button. Don't use the username/password + "Sign in" button (blue).
- Add an SSH key at your account preferences, see <https://projects.fhict.nl/-/profile/keys>

For elaborate help about adding an SSH key, see <https://projects.fhict.nl/help/ssh/index.md>
For a 'quick' walkthrough for Windows, read on.

(for Linux and Mac: the .ssh directories are present in your user folder, and the ssh tools are already present on your machine).

For windows: first make sure you have an ssh client software on your PC.
E.g for windows, its included in the install of <https://git-scm.com/download/win> .

Test if you have it by starting the command line tool (Window start button, Command Prompt)

```
> ssh.exe
```

If it executes... ok.

If it does not execute, then install the build-in Windows OpenSSH client by using the Start menu, Open Settings, select Apps > Apps & Features, then select Optional Features. Find OpenSSH Client, then click Install (you dont need the OpenSSH server).

If it does not exist, create the ssh directory, e.g. "C:\Users\JohnDoe\.ssh" (replace JohnDoe by your own user name).

Go to that directory, and create an SSH key, by using on the command line:

```
> ssh-keygen -t ed25519 -C "put your fontys mail address over here"
```

If asked to enter a file name, use "id_ed25519"

(if you use another file name, then you have to take additional steps to configure SSH to use that file (in the ssh config).

If asked for a passphrase: leave empty

Two files will be generated now, "id_ed25519" and "id_ed25519.pub" (containing the private and the public encryption keys)

After generating the keys, put the content of the file "id_ed25519.pub" in the 'key' field at <https://projects.fhict.nl/-/profile/keys>, and press 'Add key'.

Test the configuration on your windows command prompt:

```
> ssh -T git@projects.fhict.nl
```

The response should be "Welcome to GitLab, @<username>!", where <username> is your i-number, e.g. "I567893"

If you run into trouble, use to debug:

```
> ssh -vT git@projects.fhict.nl
```

Now you should be able to clone the project by using SSH, by using e.g.

```
> git clone git@projects.fhict.nl:t6-rb/spring-22/some-nice-project.git
```

(The clone link/repos link for a project can be obtained by pressing the blue "Clone" button that you can find at the GitLab webpage of the project.
